## Worksheet Ideas for the Mathematics Reading Day Study Session Math 1553, Spring 2017

1. The following are instructions for a linear algebra game, MatrixToe. It is similar to tic-tac-toe, and is meant for two players.

- There are two players, the 1-player (1P) and the 0-player (0P).
- 0 P and 1 P take turns placing numbers into an empty $N \times N$ matrix
- the game ends when all the matrix elements have a number.
- 1P: can only place 1's in the matrix, wins if the matrix is invertible.
- OP: can only place 0's in the matrix, wins if the matrix is singular.
(a) Let $N=3$. Decide who is the 1 P and the 0 P , who goes first, play a few games of Matrix Toe, and determine who won for each game.
a) Game 1 : $(\quad)$

Who won? ___ Why?
b) Game 2:

Who won? $\qquad$ Why?
c) Game 3:

Who won? $\qquad$ Why?
(b) Describe at least three strategies that the 0P might use to win.
(c) If possible, fill in the missing elements of the matrices below with numbers 0 or 1 , so that each of the matrices are singular. If it is not possible to do so, state why.

$$
\begin{aligned}
& A=\left(\begin{array}{ll}
1 & \\
& 1
\end{array}\right), \quad B=\left(\begin{array}{lll}
1 & 0 & 0 \\
0 & 1 & 1 \\
0 & & 1
\end{array}\right), \quad C=\left(\begin{array}{lll}
1 & 0 & 1 \\
1 & & 1 \\
0 & 0 & 1
\end{array}\right), \\
& D=\left(\begin{array}{lll}
1 & & 1 \\
0 & 1 & 1 \\
0 & 0 & 1
\end{array}\right), \quad E=\left(\begin{array}{llll}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
& & 1 & 1 \\
& & & 1
\end{array}\right)
\end{aligned}
$$

Hint: you can solve this problem by inspection. You don't need to use row reduction. A few games of MatrixToe may help you see why.
2. If possible, give an example of the following.
(a) A matrix whose columns form an orthogonal basis for $\mathbb{R}^{4}$.
(b) A matrix $A$ that is in echelon form, and

$$
\begin{aligned}
\operatorname{dim}\left((\operatorname{Row}(A))^{\perp}\right) & =2 \\
\operatorname{dim}\left((\operatorname{Col}(A))^{\perp}\right) & =3
\end{aligned}
$$

(c) A vector $\vec{v} \in \mathbb{R}^{3}$ and a subspace $W$ such that $\operatorname{proj}_{W} \vec{v}=\vec{v}$, and $\operatorname{dim}(W)=2$.
(d) An orthogonal matrix, in echelon form, whose columns span a 2-dimensional subspace of $\mathbb{R}^{3}$.
(e) A matrix $C$ such that the linear system $C \vec{x}=\vec{b}$ is inconsistent but has a unique least-squares solution, where $\vec{x} \in \mathbb{R}^{3}$ and

$$
\vec{b}=\binom{1}{1}
$$

(f) A subspace $S$, of $\mathbb{R}^{4}$, that satisfies $\operatorname{dim}(S)=\operatorname{dim}\left(S^{\perp}\right)=2$.
(g) Two linearly independent vectors that are orthogonal to $\left(\begin{array}{c}2 \\ 0 \\ -1\end{array}\right)$.
(h) A subspace, $S$, of $\mathbb{R}^{3}$ such that $\operatorname{dim}\left(S^{\perp}\right)=2$.
(i) A $2 \times 3$ matrix whose columns are linearly independent.
(j) A $2 \times 2$ matrix that is invertible and does not have an LU decomposition.
(k) A $2 \times 2$ matrix whose eigenvalues are $\lambda_{1}=2$ and $\lambda_{2}=0$, and whose corresponding eigenvectors are

$$
\vec{v}_{1}=\binom{1}{0}, \quad \vec{v}_{2}=\binom{1}{2}
$$

(l) An invertible $2 \times 2$ matrix whose determinant is zero.
(m) A $2 \times 2$ matrix that is diagonalizable but not invertible.
(n) A $4 \times 3$ matrix in reduced echelon form, whose columns span $\mathbb{R}^{4}$.
(o) A $3 \times 3$ matrix $C$, that is in reduced echelon form, has exactly two pivots, and satisfies

$$
C\left(\begin{array}{c}
2 \\
-8 \\
1
\end{array}\right)=\overrightarrow{0}
$$

3. Match the items in the column on the left with the items in the column on the right. Some items match to multiple items.
(a) $\operatorname{Proj}_{\vec{x}} \vec{y}$
(b) A set of vectors includes the zero vector.
(c) $\operatorname{det} A \operatorname{det} B$
(d) Every column of $A$ has a pivot
(e) A basis for $\operatorname{Col}(A)$.
(f) $U$ is an orthogonal matrix.
(g) Orthogonal complement $W^{\perp}$
(h) $(\operatorname{Row} A)^{\perp}$
(i) $(\operatorname{Col} A)^{\perp}$
(j) Orthonormal vectors
(k) $A$ is singular
(l) 0 is not an eigenvalue of $A$
(m) $P D^{k} P^{-1}$
(n) $A$ is a $3 \times 4$ matrix with linearly independent columns.
(o) Orthogonal projection of $\vec{y}$ onto $V$
(p) $A$ does not have an LU decomposition
(q) $A$ has the decomposition $A=P D P^{-1}$
(r) $T$ is a linear transformation whose standard matrix, $A$, is one-to-one.
(I) $\{\vec{x}: \vec{x} \cdot \vec{w}=0$ for all $\vec{w} \in W\}$
(II) $\frac{\vec{x} \cdot \vec{y}}{\vec{x} \cdot \vec{x}} \vec{x}$
(III) Unit length, pairwise orthogonal
(IV) $\operatorname{det}(A)=0$
(V) Not possible
(VI) $\operatorname{det}(A) \neq 0$
(VII) $\left(P D P^{-1}\right)^{k}$
(VIII) Row swaps are needed to express $A$ in echelon form.
(IX) Null $A$
(X) The vector $\hat{y} \in V$ closest to $\vec{y}$.
(XI) $\mathrm{Null} A^{T}$
(XII) The eigenvalues of $A$ are distinct.
(XIII) Its columns are orthonormal.
(XIV) The vectors are linearly dependent.
(XV) The system $A \vec{x}=\overrightarrow{0}$ has only the trivial solution.
(XVI) The columns of $A$ are linearly independent.
(XVII) The pivot columns of $A$.
(XVIII) $\operatorname{det}(A B)$
