Today's Learning Goals

- Identify which types of integrals can be solved with a trigonometric substitution
- Learn which substitution matches which general form
- Evaluate integrals using the method of trigonometric substitution

Trigonometric Substitutions

We use a trig substitution when no other integration method will work, and when the integral contains one of these terms:

$$a^2-x^2$$
$$x^2-a^2$$
$$a^2+x^2$$

Form 1:

When the integral contains a term of the form a^2-x^2,

use the substitution:

$$\boxed{x = a\sin\theta}$$

Form 2:

When the integral contains a term of the form a^2+x^2,

use the substitution:

$$\boxed{x = a\tan\theta}$$

Form 3:

When the integral contains a term of the form x^2-a^2,

use the substitution:

$$\boxed{x = a\sec\theta}$$

$$\int \sqrt{4-x^2}\,dx$$

Form 1:

When the integral contains a term of the form

$$a^2 - x^2,$$

use the substitution:

$$\boxed{x = a\sin\theta}$$

$$\int \frac{1}{\left(9+x^2\right)^{3/2}}\,dx$$

Form 2:

When the integral contains a term of the form

$$a^2 + x^2,$$

use the substitution:

$$\boxed{x = a\tan\theta}$$

$$\int \frac{1}{x^4\sqrt{x^2-1}}\,dx$$

Form 3:

When the integral contains a term of the form $x^2 - a^2$,

use the substitution:

$$x = a\sec\theta$$

$$\int_0^2 \frac{dx}{8 + 2x^2}$$

$$\int_0^{1/2\sqrt{2}} \frac{2\,dx}{\sqrt{1-4x^2}}$$

$$\int_0^{\ln 4} \frac{e^t\,dt}{\sqrt{e^{2t}+9}}$$

Today's Learning Goals

- Review partial fraction decomposition from algebra
- Learn to write partial fraction decompositions for functions with denominators that factor into products of linear and/or irreducible quadratic terms
- Evaluate integrals using the method of partial fractions

When to Use Partial Fractions:

Use the method of partial fractions to evaluate the integral of a *rational function* when:

- The degree of the numerator is *less than* that of the denominator.
- The denominator can be *completely factored* into linear and/or irreducible quadratic terms.

$$\int \frac{x^3+4x^2}{2x^2+8x-10}\,dx$$

Partial Fractions Procedure:

1. If the leading coefficient of the denominator is not a "1", factor it out.
2. If the degree of the numerator is greater than that of the denominator, carry out long division first.
3. Factor the denominator completely into linear and/or irreducible quadratic terms.
4. For each linear term of the form $(x-a)^k$, you will have *k* partial fractions of the form:

$$\frac{A_1}{x-a}+\frac{A_2}{(x-a)^2}+\frac{A_3}{(x-a)^3}+\dots+\frac{A_k}{(x-a)^k}$$

(note: if *k*=1, there is only one fraction, etc.)

5. For each irreducible quadratic term of the form $(x^2+bx+c)^m$, you will have *m* partial fractions of the form:

$$\frac{A_1x+B_1}{x^2+bx+c}+\frac{A_2x+B_2}{\left(x^2+bx+c\right)^2}+\frac{A_3x+B_3}{\left(x^2+bx+c\right)^3}+\dots+\frac{A_mx+B_m}{\left(x^2+bx+c\right)^m}$$

(note: if *m*=1, there is only one fraction, etc.)

6. Solve for all the constants A_i and B_i. To solve:
   - Multiply everything by the common denominator.
   - Combine all like terms, then solve equations for all the A_i and B_i terms; OR plug in values to find equations for A_i and B_i terms.
7. Integrate using all the integration methods we have learned.

$$\int \frac{x^2 - 1}{x(x^2 + 1)^2} dx$$

$$\int_{\frac{\pi}{3}}^{\frac{\pi}{2}} \frac{\sin \vartheta}{\cos^2 \vartheta + \cos \vartheta - 2} d\vartheta$$

For example

Example

$$\lim_{x\to+\infty} \sqrt{x^2-2} - x = \lim_{x\to+\infty} \frac{(\sqrt{x^2-x}-x)\cdot(\sqrt{x^2-x}+x)}{\sqrt{x^2-x}+2} =$$

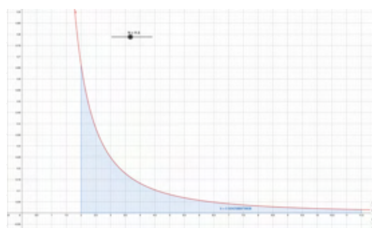
$$= \lim_{x\to+\infty} \frac{-x}{x^{\frac{2}{2}}+x} = \lim_{x\to+\infty} \frac{-x}{2x} = \frac{-1}{2}$$



Ex. Evaluate. $\displaystyle\int_0^4 \frac{1}{\sqrt{x}}\,dx$

$$\int_{\frac{\pi}{2}}^{\pi} \tan(x)\,dx$$

$$\int_{-1}^{32} x^{-1/5}\,dx$$

Improper integrals

A definite integral is improper if:

- The function has a vertical asymptote at *x=a*, *x=b*, or at some point *c* in the interval (*a*,*b*).
- One or both of the limits of integration are infinite (positive or negative infinity).

Which integral(s) is (are) improper?

1) $\int_{0}^{\frac{\pi}{4}} \tan(2x)\,dx$

2) $\int_{-1}^{1} \frac{x-3}{x^2-2x-3}\,dx$

3) $\int_{0}^{\frac{\pi}{2}} \cos(x)\,dx$

4) $\int_{0}^{3} \frac{x-2}{x^2-6x+8}\,dx$

Convergence of an Integral

- If an improper integral evaluates to a finite number, we say it ***converges***.
- If the integral evaluates to ±∞ or to, ∞- ∞, we say the integral ***diverges***.

LUB and GLB

- An *upper bound* of a set S is a number *M* that is greater than or equal to each element in S.
- The smallest possible upper bound is called the *least upper bound* (l.u.b.).
- A *lower bound* of a set S is a number *m* that is less than or equal to each element in S.
- The largest possible lower bound is called the *greatest lower bound* (g.l.b.).

Find the l.u.b. and g.l.b. of the sequence: $\left\{\frac{n+1}{n}\right\}$

A. l.u.b.=1, g.l.b.=0
B. l.u.b.=2, g.l.b.=0
C. l.u.b.=2, g.l.b.=1
D. No l.u.b., g.l.b.=0

Monotone Sequences

A sequence is called *monotonic* if one of the following statements hold:

(*i*) $a_n < a_{n+1}$ for all n (strictly increasing)
(*ii*) $a_n \le a_{n+1}$ for all n (monotonically increasing)
(*iii*) $a_n > a_{n+1}$ for all n (strictly decreasing)
(*iv*) $a_n \ge a_{n+1}$ for all n (monotonically decreasing)

Convergence Theorem

If a sequence $\{a_n\}$ is *monotonic* and *bounded*, then it converges.

If the sequence is increasing, then *L*=l.u.b.

If the sequence is decreasing, then *L*=g.l.b.
