A Single Linear Equation

$$y = mx + b$$

A linear equation has the form

$$a_1x_1 + a_2x_2 + \dots + a_nx_n = b$$

$$Ax = By = C$$

a_1, \dots, a_n , and b are the **coefficients**. x_1, \dots, x_n are the **variables** or **unknowns**, and n is the **dimension**, or number of variables.

For example,

- + $2x_1 + 4x_2 = 4$ is a line in two dimensions
- + $3x_1 + 2x_2 + x_3 = 6$ is a plane in three dimensions

Section 1.1 Slide 3

Systems of Linear Equations

When we have more than one linear equation, we have a **linear system** of equations. For example, a linear system with two equations is

$$\begin{aligned} x_1 + 1.5x_2 + x_3 &= 4 \\ 5x_1 + 7x_2 &= 5 \end{aligned}$$

Definition: Solution to a Linear System

The set of all possible values of x_1, x_2, \dots, x_n that satisfy all equations is the **solution** to the system.

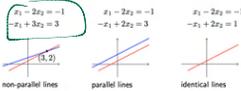

A system can have a unique solution, no solution, or an infinite number of solutions.

Three-Dimensional Case / Scalars (numbers) coefficients.

An equation $a_1x_1 + a_2x_2 + a_3x_3 = b$ defines a plane in \mathbb{R}^3 . The solution to a system of three equations is the set of intersections of the planes.

Row Reduction by Elementary Row Operations

How can we find the solution set to a set of linear equations?

We can manipulate equations in a linear system using **row operations**.

- (Replacement/Addition) Add a multiple of one row to another.
- (Interchange) Interchange two rows.
- (Scaling) Multiply a row by a non-zero scalar.

Let's use these operations to solve a system of equations.

Example 1

Identify the solution to the linear system.

$$\begin{cases} x_1 - 2x_2 + x_3 = 0 \\ 2x_2 - 8x_3 = 8 \\ 5x_1 - 5x_3 = 10 \end{cases}$$

$$R_1 + R_2 \rightarrow R_2$$

$$\begin{cases} x_1 - 2x_2 + x_3 = 0 \\ 2x_2 - 8x_3 = 8 \\ 5x_1 - 5x_3 = 10 \end{cases}$$

$$\sim \begin{cases} x_1 - 2x_2 + x_3 = 0 \\ x_1 - 7x_3 = 8 \\ 5x_1 - 5x_3 = 10 \end{cases}$$

$$-5R_1 + R_3 \rightarrow R_3$$

$$\sim \begin{cases} x_1 - 2x_2 + x_3 = 0 \\ 2x_2 - 8x_3 = 8 \\ 0x_1 + 10x_2 - 10x_3 = 10 \end{cases}$$

$$\begin{aligned} \frac{1}{2}R_2 \rightarrow R_2 \\ \frac{1}{10}R_3 \rightarrow R_3 \end{aligned} \sim \begin{cases} x_1 - 2x_2 + x_3 = 0 \\ x_2 - 4x_3 = 4 \\ x_2 - x_3 = 1 \end{cases}$$

$$-R_2 + R_3 \rightarrow R_3 \sim \begin{cases} x_1 - 2x_2 + x_3 = 0 \\ x_2 - 4x_3 = 4 \\ 3x_3 = -3 \end{cases}$$

Augmented Matrices

It is redundant to write x_1, x_2, x_3 again and again, so we rewrite systems using matrices. For example,

$$\begin{array}{r} x_1 - 2x_2 + x_3 = 0 \\ 2x_2 - 8x_3 = 8 \\ 5x_1 - 5x_3 = 10 \end{array}$$

can be written as the **augmented matrix**.

$$\left[\begin{array}{ccc|c} 1 & -2 & 1 & 0 \\ 0 & 2 & -8 & 8 \\ 5 & 0 & -5 & 10 \end{array} \right]$$

The vertical line reminds us that the first three columns are the coefficients to our variables $x_1, x_2,$ and x_3 .

Consistent Systems and Row Equivalence

Definition (Consistent)

A linear system is **consistent** if it has at least one _____.

Definition (Row Equivalence)

Two matrices are **row equivalent** if a sequence of _____ transforms one matrix into the other.

Note: if the augmented matrices of two linear systems are row equivalent, then they have the same solution set.

Consistent Systems and Row Equivalence

Definition (Consistent)

A linear system is **consistent** if it has at least one

Soln.

Definition (Row Equivalence)

Two matrices are **row equivalent** if a sequence of row operations transforms one matrix into the other.

Note: if the augmented matrices of two linear systems are row equivalent, then they have the same solution set.

Section 1.1 Slide 10

Fundamental Questions

Two questions that we will revisit many times throughout our course.

1. Does a given linear system have a solution? In other words, is it consistent?
2. If it is consistent, is the solution unique?

Section 1.1 Slide 11

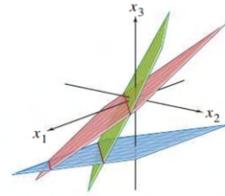

EXAMPLE 3 Determine if the following system is consistent:

$$x_2 - 4x_3 = 8$$

$$2x_1 - 3x_2 + 2x_3 = 1$$

$$4x_1 - 8x_2 + 12x_3 = 1$$

(5)

The system is inconsistent because there is no point that lies on all three planes.

Q: Are there any solus?

Soln.

$$? \left[\begin{array}{ccc|c} 0 & 1 & -4 & 8 \\ 2 & -3 & 2 & 1 \\ 4 & -8 & 12 & 1 \end{array} \right] \sim \left[\begin{array}{ccc|c} 2 & -3 & 2 & 1 \\ 0 & 1 & -4 & 8 \\ 4 & -8 & 12 & 1 \end{array} \right]$$

$$\sim \left[\begin{array}{ccc|c} 2 & -3 & 2 & 1 \\ 0 & 1 & -4 & 8 \\ 0 & -2 & 8 & -1 \end{array} \right] \quad -2R_1 + R_3 \rightarrow$$

$$\sim \left[\begin{array}{ccc|c} 2 & -3 & 2 & 1 \\ 0 & 1 & -4 & 8 \\ 0 & 0 & 0 & 15 \end{array} \right] \quad 2R_2 + R_3 \rightarrow$$

$$2x_1 - 3x_2 + 2x_3 = 1$$

$$x_2 - 4x_3 = 8$$

$$0x_1 + 0x_2 + 0x_3 = 15$$

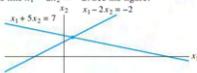

LHS always says 0
no matter what
 x_1, x_2, x_3 are!

1.1 EXERCISES

Solve each system in Exercises 1–4 by using elementary row operations on the equations or on the augmented matrix. Follow the systematic elimination procedure described in this section.

1. $x_1 + 5x_2 = 7$ 2. $2x_1 + 4x_2 = -4$
 $-2x_1 - 7x_2 = -5$ $5x_1 + 7x_2 = 11$

3. Find the point (x_1, x_2) that lies on the line $x_1 + 5x_2 = 7$ and on the line $x_1 - 2x_2 = -2$. See the figure.

4. Find the point of intersection of the lines $x_1 - 5x_2 = 1$ and $3x_1 - 7x_2 = 5$.

Consider each matrix in Exercises 5 and 6 as the augmented matrix of a linear system. State in words the next two elementary row operations that should be performed in the process of solving the system.

5. $\begin{bmatrix} 1 & -4 & 5 & 0 & 7 \\ 0 & 1 & -3 & 0 & 6 \\ 0 & 0 & 1 & 0 & 2 \\ 0 & 0 & 0 & 1 & -5 \\ 0 & 0 & 0 & 1 & -2 \end{bmatrix}$

6. $\begin{bmatrix} 1 & -6 & 4 & 0 & -1 \\ 0 & 2 & -7 & 0 & 4 \\ 0 & 0 & 1 & 2 & -3 \\ 0 & 0 & 3 & 1 & 6 \end{bmatrix}$

In Exercises 7–10, the augmented matrix of a linear system has been reduced by row operations to the form shown. In each case, continue the appropriate row operations and describe the solution set of the original system.

7. $\begin{bmatrix} 1 & 7 & 3 & -4 \\ 0 & 1 & -1 & 3 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & -2 \end{bmatrix}$ 8. $\begin{bmatrix} 1 & -4 & 9 & 0 \\ 0 & 1 & 7 & 0 \\ 0 & 0 & 2 & 0 \end{bmatrix}$

9. $\begin{bmatrix} 1 & -1 & 0 & 0 & -4 \\ 0 & 1 & -3 & 0 & -7 \\ 0 & 0 & 1 & -3 & -1 \\ 0 & 0 & 0 & 2 & 4 \\ 0 & 0 & 0 & 2 & 4 \end{bmatrix}$

10. $\begin{bmatrix} 1 & -2 & 0 & 3 & -2 \\ 0 & 1 & 0 & -4 & 7 \\ 0 & 0 & 1 & 0 & 6 \\ 0 & 0 & 0 & 1 & -3 \end{bmatrix}$

19. $\begin{bmatrix} 1 & h & 4 \\ 3 & 6 & 8 \end{bmatrix}$ 20. $\begin{bmatrix} 1 & h & -3 \\ -2 & 4 & 6 \end{bmatrix}$

21. $\begin{bmatrix} 1 & 3 & -2 \\ -4 & h & 8 \end{bmatrix}$ 22. $\begin{bmatrix} 2 & -3 & h \\ -6 & 9 & 5 \end{bmatrix}$

In Exercises 23 and 24, key statements from this section are either quoted directly, restated slightly (but still true), or altered in some way that makes them false in some cases. Mark each statement True or False, and justify your answer. (If true, give the approximate location where a similar statement appears, or refer to a definition or theorem. If false, give the location of a statement that has been quoted or used incorrectly, or cite an example that shows the statement is not true in all cases.) Similar true/false questions will appear in many sections of the text.

An important concern in the study of heat transfer is to determine the steady-state temperature distribution of a thin plate when the temperature around the boundary is known. Assume the plate shown in the figure represents a cross section of a metal beam, with negligible heat flow in the direction perpendicular to the plate. Let T_1, \dots, T_4 denote the temperatures at the four interior nodes of the mesh in the figure. The temperature at a node is approximately equal to the average of the four nearest nodes—to the left, above, to the right, and below.² For instance,

$$T_1 = (10 + 20 + T_2 + T_4)/4, \quad \text{or} \quad 4T_1 - T_2 - T_4 = 30$$

33. Write a system of four equations whose solution gives estimates for the temperatures T_1, \dots, T_4 .
34. Solve the system of equations from Exercise 33. [Hint: To speed up the calculations, interchange rows 1 and 4 before starting “replace” operations.]

REF

row echelon form

Definition: Echelon Form

A rectangular matrix is in **echelon form** if

1. All zero rows (if any are present) are at the bottom.
2. The first non-zero entry (or **leading entry**) of a row is to the right of any leading entries in the row above it (if any).
3. Below a leading entry (if any), all entries are zero.

A matrix in echelon form is in **row reduced echelon form (RREF)** if

1. The leading entry in each row is equal to 1.
2. Each leading 1 is the only nonzero entry in that column.

Example of a Matrix in Echelon Form

■ = non-zero number, * = any number

Definition: Pivot Position, Pivot Column

A **pivot position** in a matrix A is a location in A that corresponds to a leading 1 in the reduced echelon form of A .

A **pivot column** is a column of A that contains a pivot position.

Example 2. Express the matrix in row reduced echelon form and identify the pivot columns.

$$\begin{bmatrix} 0 & -3 & -6 & 4 \\ -1 & 0 & -1 & 3 \\ -2 & -3 & 0 & 0 \end{bmatrix}$$

e.g.?

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 3 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

AKA pivots are positions in the matrix corresponding to a leading entry in any of the matrix's echelon forms

-R₁ → R₂ & R₃ → R₂

$$\begin{bmatrix} 0 & -3 & -6 & 4 \\ -1 & 0 & -1 & 3 \\ -2 & -3 & 0 & 0 \end{bmatrix} \sim \begin{bmatrix} 1 & 2 & 1 & -3 \\ 0 & -3 & -6 & 4 \\ -2 & -3 & 0 & 3 \end{bmatrix}$$

2R₁ → R₃

$$\sim \begin{bmatrix} 1 & 2 & 1 & -3 \\ 0 & -3 & -6 & 4 \\ 0 & 1 & 2 & -3 \end{bmatrix}$$

~ 3R₂ + R₂ →

$$\begin{bmatrix} 1 & 2 & 1 & -3 \\ 0 & 0 & 0 & -5 \\ 0 & 1 & 2 & -3 \end{bmatrix}$$

~

$$\begin{bmatrix} 1 & 2 & 1 & -3 \\ 0 & 1 & 2 & -3 \\ 0 & 0 & 0 & -5 \end{bmatrix}$$

Row Reduction Algorithm

The algorithm we used in the previous example produces a matrix in RREF. Its steps can be stated as follows.

- Step 1a) Swap the 1st row with a lower one so the leftmost nonzero entry is in the 1st row
- Step 1b) Scale the 1st row so that its leading entry is equal to 1
- Step 1c) Use row replacement so all entries above and below this 1 are 0
- Step 2a) Cover the first row, swap the 2nd row with a lower one so that the leftmost nonzero (uncovered) entry is in the 2nd row; uncover 1st row
- etc.

Basic And Free Variables

Consider the augmented matrix *to be free.*

$$\begin{bmatrix} 1 & 3 & 0 & 7 & 0 & 4 \\ 0 & 0 & 1 & 4 & 0 & 5 \\ 0 & 0 & 0 & 0 & 1 & 6 \end{bmatrix}$$

- The leading one's are in first, third, and fifth columns. So:
- Its pivot variables are $x_1, x_3,$ and x_5 .
 - The free variables are x_2 and x_4 . **Any choice** of the free variables leads to a solution of the system.

... more steps.

$$\sim \begin{bmatrix} 1 & 0 & * & 0 \\ 0 & 1 & * & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

From left to right

get RREF

$$\begin{bmatrix} * & * & * & * \\ 0 & 0 & * & * \\ 0 & 0 & * & * \\ 0 & 0 & 0 & * \end{bmatrix} \sim \begin{bmatrix} * & * & * & * \\ 0 & 0 & * & * \\ 0 & 0 & * & * \\ 0 & 0 & 0 & * \end{bmatrix}$$

from right to left.

Existence and Uniqueness

Theorem

A linear system is consistent if and only if (exactly when) the last column of the augmented matrix does not have a pivot. This is the same as saying that the RREF of the augmented matrix does **not** have a row of the form

$$[0 \ 0 \ 0 \ \dots \ 1]$$

Moreover, if a linear system is consistent, then it has

1. a unique solution if and only if there are no **Free vars.**
2. ∞ many solutions that are parameterized by free variables.

Theorem Box

Note: If every col. of an aug. matrix is pivotal \Rightarrow System inconsistent.

USING ROW REDUCTION TO SOLVE A LINEAR SYSTEM

1. Write the augmented matrix of the system.
2. Use the row reduction algorithm to obtain an equivalent augmented matrix in echelon form. Decide whether the system is consistent. If there is no solution, stop; otherwise, go to the next step.
3. Continue row reduction to obtain the reduced echelon form.
4. Write the system of equations corresponding to the matrix obtained in step 3.
5. Rewrite each nonzero equation from step 4 so that its one basic variable is expressed in terms of any free variables appearing in the equation.

ie. every column of coeff matrix is pivotal

Motivation

We want to think about the **algebra** in linear algebra (systems of equations and their solution sets) in terms of **geometry** (points, lines, planes, etc).

$$\begin{aligned}x - 3y &= -3 \\ 2x + y &= 8\end{aligned}$$

- This will give us better insight into the properties of systems of equations and their solution sets.
- To do this, we need to introduce n -dimensional space \mathbb{R}^n , and **vectors** inside it.

Section 1.3 Slide 23

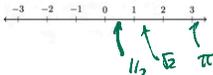

\mathbb{R}^n

Recall that \mathbb{R} denotes the collection of all real numbers.

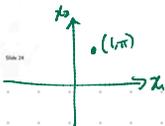

Let n be a positive whole number. We define

\mathbb{R}^n = all ordered n -tuples of real numbers $(x_1, x_2, x_3, \dots, x_n)$.

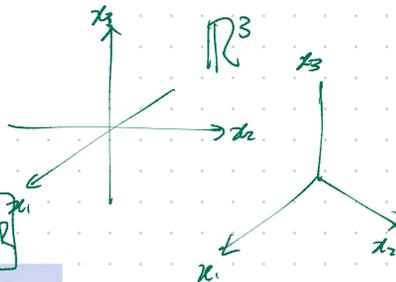

When $n = 1$, we get \mathbb{R} back: $\mathbb{R}^1 = \mathbb{R}$. Geometrically, this is the number line.

Section 1.3 Slide 24

$$\mathbb{R}^n = (x_1, \dots, x_n), x_i \in \mathbb{R}$$

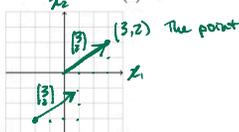

\mathbb{R}^2

Note that:

- when $n = 2$, we can think of \mathbb{R}^2 as a **plane**
- every point in this plane can be represented by an ordered pair of real numbers, its x - and y -coordinates

Example: Sketch the point $(3, 2)$ and the vector $\begin{pmatrix} 3 \\ 2 \end{pmatrix}$.

Section 1.3 Slide 25

Vectors

In the previous slides, we were thinking of elements of \mathbb{R}^n as **points**: in the line, plane, space, etc.

We can also think of them as **vectors**: arrows with a given length and direction.

For example, the vector $\begin{pmatrix} 3 \\ 2 \end{pmatrix}$ points **horizontally** in the amount of its x -coordinate, and **vertically** in the amount of its y -coordinate.

Section 1.3 Slide 26

Vector Algebra

When we think of an element of \mathbb{R}^n as a vector, we write it as a matrix with n rows and one column:

$$\vec{v} = \begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix} \quad 3\vec{v} = 3 \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} = \begin{bmatrix} 3 \\ 6 \\ 9 \end{bmatrix}$$

Suppose

$$\vec{u} = \begin{pmatrix} u_1 \\ u_2 \end{pmatrix}, \quad \vec{v} = \begin{pmatrix} v_1 \\ v_2 \end{pmatrix}$$

Vectors have the following properties.

1. **Scalar Multiple:**

$$c\vec{u} =$$

2. **Vector Addition:**

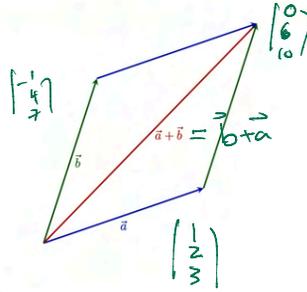

$$\vec{u} + \vec{v} =$$

Note that vectors in higher dimensions have the same properties.

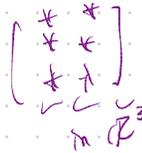

Section 1.3 Slide 27

$$\begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} + \begin{bmatrix} -1 \\ 4 \\ 7 \end{bmatrix} = \begin{bmatrix} 0 \\ 6 \\ 10 \end{bmatrix}$$

Linear Combinations and Span

Definition

1. Given vectors $\vec{v}_1, \vec{v}_2, \dots, \vec{v}_p \in \mathbb{R}^n$, and scalars c_1, c_2, \dots, c_p , the vector below

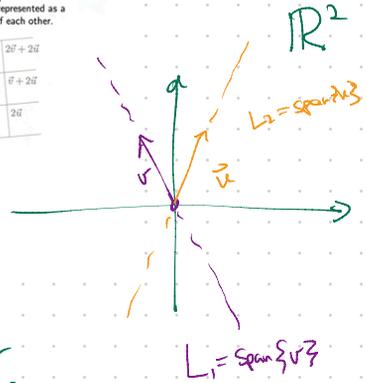

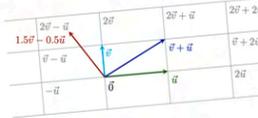

$$\vec{w} = c_1\vec{v}_1 + c_2\vec{v}_2 + \dots + c_p\vec{v}_p$$

is called a **linear combination** of $\vec{v}_1, \vec{v}_2, \dots, \vec{v}_p$ with **weights** c_1, c_2, \dots, c_p .

2. The set of all linear combinations of $\vec{v}_1, \vec{v}_2, \dots, \vec{v}_p$ is called the **Span** of $\vec{v}_1, \vec{v}_2, \dots, \vec{v}_p$.

Geometric Interpretation of Linear Combinations

Note that any two vectors in \mathbb{R}^2 that are not scalar multiples of each other, span \mathbb{R}^2 . In other words, any vector in \mathbb{R}^2 can be represented as a linear combination of two vectors that are not multiples of each other.

Section 1.3 Slide 29

$$3 \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} + (-2) \begin{bmatrix} -1 \\ 4 \\ 7 \end{bmatrix} = \begin{bmatrix} 5 \\ -2 \\ -5 \end{bmatrix}$$

Section 1.3 Slide 30

is a linear combination of $\begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}, \begin{bmatrix} -1 \\ 4 \\ 7 \end{bmatrix}$.

Q: $c_1 \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} + c_2 \begin{bmatrix} -1 \\ 4 \\ 7 \end{bmatrix} = \begin{bmatrix} 5 \\ 10 \\ 15 \end{bmatrix}$ ← what could this be?

are c_1, c_2 that work?

A: yes by observation $c_1 = 5, c_2 = 0$.

Example

Is \vec{w} in the span of vectors \vec{v}_1 and \vec{v}_2 ?

$\vec{v}_1 = \begin{pmatrix} 1 \\ -2 \\ -3 \end{pmatrix}$, $\vec{v}_2 = \begin{pmatrix} 2 \\ 5 \\ 6 \end{pmatrix}$, and $\vec{w} = \begin{pmatrix} 7 \\ 4 \\ 15 \end{pmatrix}$.

Q1: yes or no
 $\vec{w} \in \text{Span}\{\vec{v}_1, \vec{v}_2\}$

Q2: If yes then
Find c_1, c_2 s.t.
 $c_1\vec{v}_1 + c_2\vec{v}_2 = \vec{w}$

Soln.

Are there c_1, c_2 s.t. this works?

$c_1 \begin{pmatrix} 1 \\ -2 \\ -3 \end{pmatrix} + c_2 \begin{pmatrix} 2 \\ 5 \\ 6 \end{pmatrix} = \begin{pmatrix} 7 \\ 4 \\ 15 \end{pmatrix}$

$\Rightarrow \begin{bmatrix} c_1 \\ -2c_1 \\ -3c_1 \end{bmatrix} + \begin{bmatrix} 2c_2 \\ 5c_2 \\ 6c_2 \end{bmatrix} = \begin{bmatrix} c_1 + 2c_2 \\ -2c_1 + 5c_2 \\ -3c_1 + 6c_2 \end{bmatrix} \stackrel{?}{=} \begin{bmatrix} 7 \\ 4 \\ 15 \end{bmatrix}$

$\Rightarrow \begin{cases} c_1 + 2c_2 = 7 \\ -2c_1 + 5c_2 = 4 \\ -3c_1 + 6c_2 = 15 \end{cases}$

all must be true at the same time!

Soln: $\left[\begin{array}{cc|c} 1 & 2 & 7 \\ -2 & 5 & 4 \\ -3 & 6 & 15 \end{array} \right] \sim \begin{array}{l} 2R_1 + R_2 \rightarrow \\ 3R_1 + R_3 \rightarrow \end{array} \left[\begin{array}{cc|c} 1 & 2 & 7 \\ 0 & 9 & 18 \\ 0 & 12 & 36 \end{array} \right]$

$\sim \begin{array}{l} \frac{1}{9}R_2 \rightarrow \\ \frac{1}{12}R_3 \rightarrow \end{array} \left[\begin{array}{cc|c} 1 & 2 & 7 \\ 0 & 1 & 2 \\ 0 & 1 & 3 \end{array} \right]$

The Span of Two Vectors in \mathbb{R}^3

In the previous example, did we find that \vec{w} is in the span of \vec{v}_1 and \vec{v}_2 ?

In general: Any two non-parallel vectors in \mathbb{R}^3 span a plane that passes through the origin. Any vector in that plane is also in the span of the two vectors.

FIGURE 10

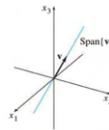

FIGURE 10 Span $\{v\}$ is a line through the origin.

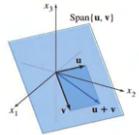

FIGURE 11 Span $\{u, v\}$ is a plane through the origin.

Warning:

in \mathbb{R}^3
they could be non-collinear (none are scalar of any other) but still span a plane in \mathbb{R}^3
