## PA#2B- §12.5: Lines and Planes

Consider the planes  $x + 2y - z = 4$  and  $2x - y + z = 1$ . Explain in a few words why the planes must intersect. Then, find the line which passes through the point  $P(1, 1, 1)$  and is parallel to the line of intersection of the two planes.

$\vec{n}_1 = \langle 1, 2, -1 \rangle$  normal vector of first plane

$\vec{n}_2 = \langle 2, -1, 1 \rangle$  normal vector of second plane

Notice planes intersect since  $\vec{n}_1 \not\parallel \vec{n}_2$  are  
NOT PARALLEL.

Line of intersection is  $\ell(t) = \vec{OP} + t\vec{v}$ ,  $t \in \mathbb{R}$

w/  $P(1, 1, 1)$  and  $\vec{v} = \vec{n}_1 \times \vec{n}_2$ .

So  $\vec{v} = \langle 1, 2, -1 \rangle \times \langle 2, -1, 1 \rangle$

$$\begin{aligned}
 &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 2 & -1 \\ 2 & -1 & 1 \end{vmatrix} = \hat{i}(2-1) - \hat{j}(1+2) + \hat{k}(-1-4) \\
 &= \langle 1, -3, -5 \rangle
 \end{aligned}$$

So

$$\ell(t) = \langle 1, 1, 1 \rangle + t\langle 1, -3, -5 \rangle, t \in \mathbb{R}$$
